

Leep Procedure

The Leep procedure removes abnormal cells when treating Dysplasia. Leep uses a thin wire loop that acts like a scalpel. An electric current is passed through the loop, which cuts away a thin layer of the surface cells.

After the Leep procedure is done, you may experience some vaginal discharge of dark red to brown in color for several days. Report any bleeding heavier than your normal period to your physician. While the cervix heals, do not put anything into your vagina for at least four weeks to include:

- No sexual intercourse.
- No tub baths.
- No vaginal douches.
- No use of tampons.

You may take Tylenol, 2 tablets, or Advil, 2 tablets, every 4 hours for discomfort.
